

PUGET SOUND VITAL SIGNS

VITAL Sign GROUNDFISH AND BENTHIC INVERTEBRATES

Groundfish and benthic invertebrates include dozens of resident marine fish that live on or near the seafloor as well as crabs, shrimp, and other invertebrates. This Vital Sign tells us about the abundance and distribution of groundfish and benthic invertebrates in Puget Sound. Many of these species are important to commercial and recreational fisheries and play a critical role in the region's marine food web.

KEY VITAL SIGN MESSAGES

- The marine waters of Washington State are home to over 90 species of groundfish.
 - These include: Pacific cod, Pacific tomcod, Pacific hake (or whiting), walleye pollock, all species of dabs, sole and flounders, Pacific halibut, lingcod, ratfish, sablefish, cabezon, greenling, buffalo sculpin, great sculpin, red Irish lord, brown Irish lord, rockfishes, Pacific staghorn sculpin, wolfeel, giant wrymouth, plainfin midshipman, all species of shark, skate, rockfish, rattail, and perches.
- Recent studies show below average abundances of most key groundfish stocks in Puget Sound.
 - Some of the species that once dominated the catches of recreational and commercial fisheries are now at depressed or critical abundances, resulting in historic low catches and reduced fisheries. A number of natural and human-induced factors may be responsible for the poor condition of groundfish.
 - Of the over 60 species of rockfish along the Pacific coast, 28 species are found within the Salish Sea. Two Puget Sound rockfish are listed under the Endangered Species Act (ESA): bocaccio as Endangered, and yelloweye rockfish as Threatened.
 - NOAA Fisheries currently has a [proposed listing under the ESA for the Sunflower Sea Star](#).
- The fish assemblages comprising groundfish populations utilize a variety of bottom habitat types, from complex boulder and steep rocky reefs, to cobble and sand, and fine sediments. Quantifying the available habitats is important to understanding strategies for recovery actions.
- **Forage fish** are important food resources for many groundfish species.

BACKGROUND DOCUMENTS

This is a new Vital Sign and we are working with our partners to compile and report indicator status and trends. The Washington Department of Fish and Wildlife (WDFW) has conducted systematic scientific bottom trawling in the Salish Sea since 1987. These surveys collect abundance and distribution data for a broad range of groundfish and invertebrate species and will help inform the Vital Sign indicators.
